- A - These Standard designations correspond to the values for test sieve openings recommended by the International Standards Organization, Geneva, Switzerland, except where noted.
- B - Only approximately equivalent to the metric values in Column 1.
- C - The average diameter of the wires in the x and y direction, measured separately, of any wire cloth shall not deviate from the nominal values by more than +/- 15%.
- D - These sieves are not in the standard series but they have been included because they are in common usage.
- E - These numbers (3-1/2 to 635) are the approx. number of openings per linear in. but it is preferred that the sieve be identified by the standard designation in millimeters or micronmeters.
- F - 1000 μm - 1 mm

TYLER SIEVING SOFTWARE 3.0

W.S. TYLER is excited to introduce Sieve Software 3.0.

The product was designed as a fast and simple tool to record, print and save data from a traditional Test Sieve Analysis.

The user- friendly spreadsheet format allows the user to personalize the files and detail each sieve test. The technician must enter the sieve series required and the sample weight retained on each sieve following the test run. The software will perform the rest of the calculations and create statistical and graphical displays for analysis. The Tyler Sieving Software 3.0 simplifies the Test Sieving process and is affordably priced.

SPINNING RIFFLER

The RX-230 Spinning Riffler uses a vibratory feeder to provide a constant flow of material from the stainless steel hopper. The vibrating feeder then feeds the sampling tubes from 1 to 16 individual samples. Each sample can then be capped and stored immediately, with minimal handling and little chance for outside contamination.

Spin riffling is the method of choice for sampling accuracy and reliability for dry, free flowing particles. This unit will virtually eliminate operator error and bias associated with other types of sampling devices.

The RX-230 Spinning Riffler includes a sixteen-port dividing head, a set of sixteen standard tube sample vessels, a sample drum to contain the vessels and a hopper plate for positioning the vessels in the drum. All of these parts are available as replacement parts.

NOTES: _____

COMPUTERIZED PARTICLE ANALYZER (CPA) 2-1

- The HAVER TYLER CPA 2-1 is the newest member of the Photo-Optical Particle Size and Shape Analyzers.
- The HAVER TYLER CPA 2-1 is equipped with user friendly CPA software that is compatible with current Windows™ based operating systems.
- The unit can be operated with a desktop or laptop computer. Minimum software requirements are 850 MHZ, 1g hard drive and 512 RAM. The 2-1 software includes a feature that correlates CPA raw data to traditional test sieving results.
- The new model has been designed for laboratory use measuring dry, free flowing, non-agglomerating particles.
- The CPA unit is virtually maintenance free, durable, and can be used for “in-line” process applications as well.

Technical Data:

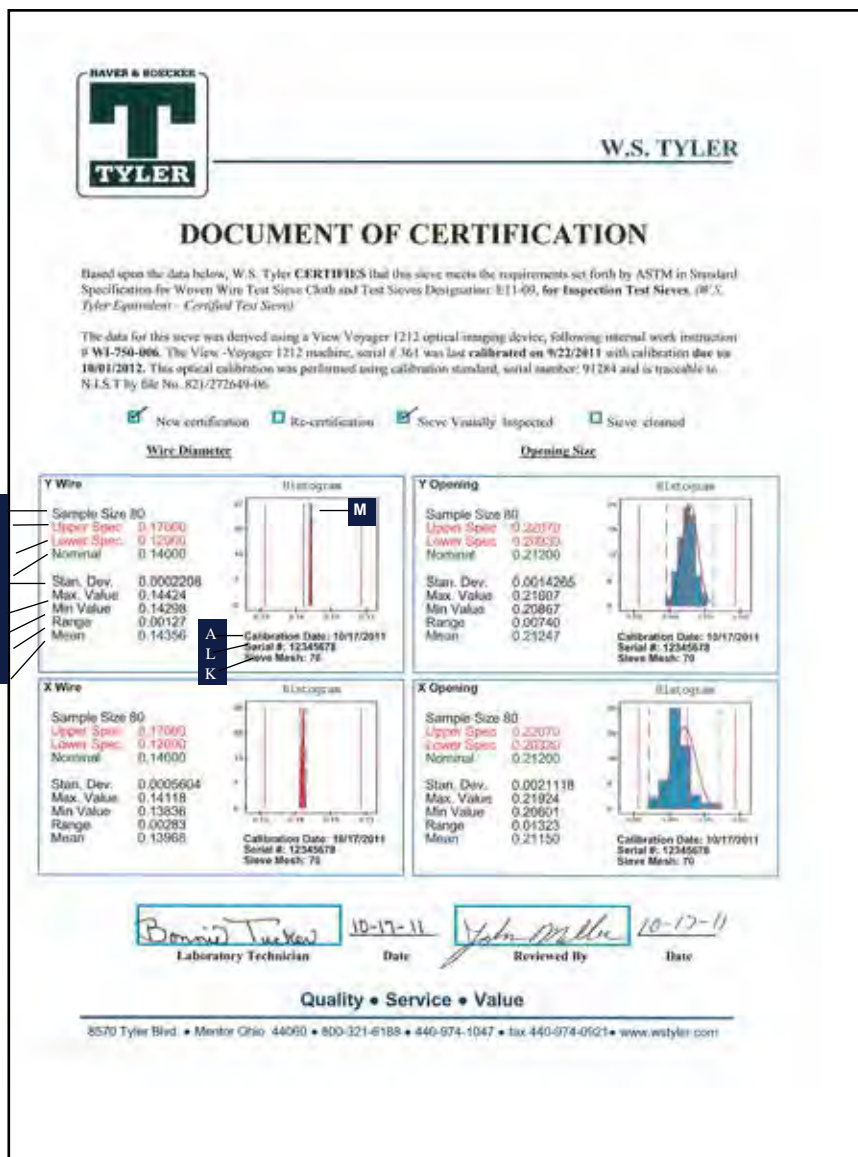

Measuring Range:	.034 mm (ASTM 400) - 25 mm (ASTM 1" OPG)
Operating Voltage:	230 v/50 Hz 120 v/60 Hz
Camera:	CCD - Line Camera
Light Source:	LED
Dimensions:	33" x 11" x 23"
Weight:	36 lbs.
Applications:	Sand, coal, sugar, salt, plastics, fertilizer, ceramics, glass, foods, pharmaceuticals and other industrial materials

W.S. Tyler Certified, Certified Plus and Matched Test Sieves are examined to meet ASTM and ISO specifications.

The openings of the sieves are measured with a computerized video imaging system. Products are then serialized and supplied with NIST traceable documents, including statistical information on opening sizes and wire diameters.

Shown here is a typical Document of Certification and descriptions of the terms used.

- A** Dimension Reference Number
 1 = Wire Diameter "x" direction
 2 = Aperture Size "x" direction
 3 = Wire Diameter "y" direction
 4 = Aperture Size "y" direction
- B** Sample Size* = Number of apertures or wire diameters measured
- C** Upper Spec. = Aperture size per ASTM E11 specification, plus tolerance
- D** Lower Spec. = Aperture size per ASTM E11 specification, minus tolerance
- E** Nominal = Specified aperture size, per ASTM E11 specification
- F** Standard Deviation = A numerical value that measures "spreading" tendency, a deviation of the values from their mean (average)
- G** Max. Measured = The largest aperture or wire diameter measured
- H** Min. Measured = The smallest aperture or wire diameter measured
- I** Range = The difference between the "max" and "min" above (rounded)
- J** Mean = Average aperture size or wire diameter measured
- K** Description = Test sieve designation/ mesh size
- L** Serial No. = Identification number of test sieves
- M** Histogram = Graphic presentation of values measured vs. corresponding number of apertures examined
